Online Resources

Take advantage of these sources to stay up to date with the best knowledge and practices.

✓ Articles/Videos
The Rapid RH web page features links to articles written by industry experts, as well as access to the Rapid RH Newsletter, Q&A, and much more. Our comprehensive video library includes a Rapid RH installation demonstration and training videos by Howard Kanare, a nationally recognized expert specializing in the interaction of concrete floors and flooring systems.

✓ Product/Technical Information
Access additional technical information about the latest in moisture testing for concrete.

✓ FAQs
Check out our FAQ reference online or call us if you have additional questions.

✓ Social Media
Join the discussion with installers, inspectors, and industry leaders on our Facebook, YouTube, Instagram, Twitter, and LinkedIn.

✓ Industry Apps
Get the free DataMaster™ L6 app for convenient Read, Record, and Report features that make concrete moisture testing easier than ever. Download the RHSpec app and get specifications from more than 120 flooring manufacturers at your fingertips.

For more resources visit www.RapidRH.com or call worldwide toll-free: (844) 296-9656
The calcium chloride test measures the moisture vapor emission rate coming from a concrete slab. However, 90% of moisture vapor emissions that a calcium chloride test sees come only from the top half-inch of the slab. Once a floor covering has been installed and drying has stopped, the slab will equilibrate and evenly distribute the moisture from top to bottom. Calcium chloride is, therefore, only a surface test, highly affected by ambient conditions in the room or building. Even if done correctly, a calcium chloride test tells you nothing about what’s going on deeper in the slab.

As with calcium chloride tests, testing with concrete moisture meters is also surface-biased. At best, they only measure 3/4” into the depth of the concrete. In addition, concrete moisture meter accuracy is negatively affected by the density variability of the concrete as well as the varying chemical and aggregate composition.

There is no ASTM standard for using moisture meters as a final determination of whether a concrete slab is dry enough for a flooring installation.

**Why It Is Crucial to Measure the Moisture Below the Surface of the Slab**

**Limits of Calcium Chloride Testing**

The calcium chloride test measures the moisture vapor emission rate coming from a concrete slab. However, 90% of moisture vapor emissions that a calcium chloride test sees come only from the top half-inch of the slab. Once a floor covering has been installed and drying has stopped, the slab will equilibrate and evenly distribute the moisture from top to bottom. Calcium chloride is, therefore, only a surface test, highly affected by ambient conditions in the room or building. Even if done correctly, a calcium chloride test tells you nothing about what’s going on deeper in the slab.

**Moisture Meters Are Shallow at Best**

As with calcium chloride tests, testing with concrete moisture meters is also surface-biased. At best, they only measure 3/4” into the depth of the concrete.

In addition, concrete moisture meter accuracy is negatively affected by the density variability of the concrete as well as the varying chemical and aggregate composition.

There is no ASTM standard for using moisture meters as a final determination of whether a concrete slab is dry enough for a flooring installation.

Moisture meters should NEVER be used to make the final determination as to whether or not a concrete slab is dry enough for a flooring installation.
